

TAD Node			
Node = (data, adjacent)			
$data \neq null \wedge adjacent \neq null \wedge \forall x \in adjacent : x \neq null$			
Primitive Operations			
Operación	Entrada	Salida	Tipo
getData()	—	T	Observer
getAdjacent()	—	List<Node<T>>	Observer

$\langle \text{getData}() \rangle$			
Returns the data of the node			
Precondition: —			
Postcondition: returns the value stored in the node			

$\langle \text{getX(Node)} \rangle$			
Returns the list of adjacent nodes connected to the node			
Precondition: —			
Postcondition: returns the list <i>adjacent</i>
